

Do you know that untreated tubes and globes may pollute our environment?

“Mercury from one fluorescent tube can pollute 30,000 litres of water beyond a safe level of drinking.”

Save the environment by recycling used lamps

Do your part to support the environment by bringing used globes and tubes to us.

GMT Lighting joins with ARA to support the recycling of fluorescent tubes and other types of lamps.

ARA is the first and only EPA approved facility in Australasia to cater for the ever increasing needs for environmentally safe treatment and recycling of mercury containing products such as fluorescent tubes, HID globes, mercury vapour lamps and a variety of other mercury containing products. ARA offers the best solution for the handling and recycling of mercury bearing waste with its technology involving both the separation of the different materials and the recovery of mercury. These processes eventually lead to the transformation of the hazardous discarded products to marketable by-product such as aluminium, glass, mercury and phosphor powder.

ARA now provides full services in Australia and New Zealand.

For your convenience, you can now bring your used lamps and tubes to GMT and we'll have them recycled for you.

Prices On Application.
